Cover image: Comparison of the time slices (at 1.714 s) from the two SOM crossplot volumes, i.e., without and with Teager Kaiser energy attribute. Both displays are corendered with multispectral coherence, which depicts the fault lineaments in black. We see that while the display to the left looks busy, and the high-amplitude anomalies marked with yellow block arrows are not clearly seen, the same anomalies are clearly seen in the display to the right and thus serve as a useful aid in interpretation.
